

When I first started I had an error and I had to go in and change all my UV mapping in the original prop, but afterwards this was so much easier than I thought it was going to be. Sometimes you just have to let the auto cut do its thing I guess. It definitely helps me see why good cuts are so important in UV mapping. I was really nervous that this was going to be even more difficult than UV mapping, but instead it's easy as long as you map well. I'm not sure why you would choose the other way to add textures like we did last year honestly.

All in all this was pretty fun actually. It took me a second to find more options for the assets. I thought when you searched it would just pull up every texture / asset, you have to

select some other buttons to find more options. (Bad UI in my opinion), but after that I just went “crazy”. If I did it again I would probably try painting more on it, but I honestly am just happy with the way it turned out.

I didn’t go particularly crazy with substance painter, but like I said before, I was really nervous that it was going to be harder than UV mapping so I picked my very simple prop. Despite that, it was fun to draw on some “blood”. I also managed to use a texture of glass as a way to make the lantern glow and seem more ghostly which I absolutely adored.

I also used that “ghost glass” as a base for the chains and top part that holds those chains, and I used it on the little decorative “arms” that are at the corners. I didn’t want everything to have the same metal base, but I still liked how it looked with the rust over it.

I even used the rust with the glass in the middle of the lantern because I thought it was a cool way to make it look grimey, and also it feels like it helps with cohesion.

I kind of wish that I could have added a candle inside and made it glow, but I have no idea how I would even start with that. I also wonder how that would affect the look of rust on the lantern. Honestly it was just cool, and it makes me want to mess around more.
